Hi Emily,

When I started the FEWD I course, I was very new to this field. I am not good at communication either. Still my communication is not that good. So I can't express my full thoughts here. When I started to design my own portfolio, I used what are all taught in class all together. I am happy to see that it gives me more confidence. Thank you very much Emily, you are a great teacher.

Statement of purpose:

I want to be a front end web developer with what i learn FEWD I & II. I make myself update to current technology to work with people who need to design web pages for their business or collaborate with the company as a part of it.

JavaScript

I include javascript in the hamburger menu which helps in the mobile version.

Another javascript is to showcase a few of my works in the course, in future i would like to add some of the content related to each project.

One more javascript is the header part when we scroll down my header will blur it helps the page content visible not to be fully blocked.

CSS animations:

Really CSS animation is an interesting part while working in a portfolio. But as if now I didn't use that much because I am a little bit bad in this area. In the future I really love to spend my time learning and practicing more in CSS animation.

In the home page I include css animation in the keyframe. But initially I tried one color circle around the logo by changing different colors to suit the black background. Due to position I missed it. So only included in the title part.

Form:

I made a very simple form as a contact page. Which contain name , email, message and send button. In future it will be too elaborate.

This mini project gives me lots of self confident to me. I am very bad in color selection and creative field but here i tried to come out of that shell.
